# DevOps Engineer (Intern)

Dakshina Dissanayake

+ 94 763 692 357 | dakshinabanu@gmail.com | LinkedIn | GitHub | Portfolio

## PROFILE

Final-year IT undergraduate and DevOps intern with hands-on experience in CI/CD pipelines, application deployment, and cloud infrastructure. Built four DevOps projects on AWS and Kubernetes using Terraform, Docker, and GitHub Actions, with Trivy security scans and Prometheus and Grafana monitoring. Familiar with Linux servers, Git, and containerized environments. Interested in automation and building reliable, low-cost infrastructure.

## PROFESSIONAL EXPERIENCE

Codezela Technologies (Pvt) Ltd | March 2026 – September 2026 | Hybrid

**DevOps Engineer Intern**

- Contributed to application deployments and releases in development and production, using Git, CI/CD workflows, and deployment pipelines.
- Worked on Linux servers, helping with server configuration, application setup, and environment management.
- Helped troubleshoot deployment and runtime issues on Linux environments.
- Worked with Docker containers, helping with their configuration, deployment, and basic maintenance.
- Helped with cloud infrastructure, application monitoring, and logging in production environments.
- Worked with the technical team on infrastructure improvements and DevOps practices.

## SKILLS

- **Cloud & Infrastructure:** AWS (EC2, VPC, IAM, S3, ECR, RDS, SQS, Amplify, SSM Parameter Store) | Vercel
- **Infrastructure as Code:** Terraform (modular)
- **CI/CD & Security:** GitHub Actions (OIDC) | Deployment Automation | Rollout & Rollback | Trivy
- **Containers & Orchestration:** Docker | Kubernetes (k3s, kind)
- **Monitoring:** Prometheus | Grafana | CloudWatch | Uptime Kuma | Logging
- **Linux & Scripting:** Linux (Ubuntu, WSL2) | Bash | Python | YAML
- **Version Control & Networking:** Git | GitHub | DNS | HTTP/HTTPS
- **Languages & Frameworks:** Python (Flask) | Java (Spring Boot) | JavaScript / TypeScript (Next.js) | SQL
- **Databases:** PostgreSQL | MySQL | MongoDB | SQLite
- **Cost Management:** AWS Free Tier optimization | Right-sizing | Budget-aware architecture

## EDUCATION

**BSc (Hons) Information Technology | 2022 – Present**

Horizon Campus, Malabe

- Current GPA: 3.48/4.0

**Passed G.C.E.(A/L) – 2020**

**Passed G.C.E.(O/L) – 2016**

## SELECTED PROJECTS

**DevOps Project | OrderFlow: DevOps Platform on AWS**

- Provisioned AWS infrastructure (VPC, subnet, security groups, EC2, ECR, IAM) with modular Terraform, and deployed a Spring Boot API and PostgreSQL on a k3s Kubernetes cluster.
- Implemented async order processing using Amazon SQS and a background worker, with a least-privilege IAM role scoped to a single queue and no stored AWS credentials.
- Built a GitHub Actions CI/CD pipeline that authenticates to AWS via OIDC (no access keys), builds the Docker image, tags it by commit SHA, and pushes it to ECR with image scanning enabled.
- Debugged a failed OIDC login by inspecting the live token claims and fixing the IAM trust policy. Cut costs by right-sizing EC2 and auditing AWS resources with a Bash script.

**DevOps Project | DeployFlow: CI/CD Pipeline for a Containerized API on AWS**

- Containerized a Python Flask API with Docker using multi-layer builds and pinned dependencies, and provisioned AWS infrastructure (EC2, VPC, IAM, S3) using Terraform.
- Built a GitHub Actions CI/CD pipeline that runs on every push: builds the Docker image, tags it by version, scans it with Trivy for vulnerabilities, and deploys it to AWS automatically.
- Implemented observability with Prometheus + Grafana dashboards and CloudWatch alarms for CPU/memory thresholds to detect issues before users report them.
- Managed AWS Free Tier costs by terminating and cleaning up resources after each phase, keeping total project spend near $0.

**DevOps Project | CloudPath: CI/CD and Kubernetes Deployment Pipeline**

- Containerized a Spring Boot API with Docker (non-root user, .dockerignore) and deployed it to a Kubernetes cluster (kind) using a Namespace, ConfigMap, Secret, Deployment and Service.
- Built a GitHub Actions pipeline that runs on every push: runs the tests, builds the app, builds the Docker image and scans it with Trivy for vulnerabilities.
- Tested release rollout and rollback, and found and documented that kubectl rollout undo does not revert ConfigMap changes, so config is restored from Git instead. Checked app health with kubectl logs, metrics-server and Spring Boot Actuator health checks.
- Defined infrastructure as code with Terraform (init, fmt, validate, plan) and verified the whole setup from scratch using only the README, at zero cloud cost.

**DevOps Project | Serene Stay: AWS Well-Architected Hotel Booking App**

- Provisioned AWS infrastructure (RDS PostgreSQL, S3, IAM, security groups) using modular Terraform IaC, and deployed a full-stack Next.js SSR application on AWS Amplify with environment secrets stored in SSM Parameter Store.
- Secured the application with IAM least-privilege policies scoped to S3 and CloudWatch only, SSL-encrypted database connections, server-side file validation (type and size), and immediate credential rotation after accidental exposure.
- Built a GitHub Actions CI/CD pipeline that runs ESLint and TypeScript checks on every push, with AWS Amplify handling automated build, deployment, and rollback on failure.
